Benchmark Prep FS — Bank Swap (1,143 Questions): AI Studio Prompt

Version · v1.0.0 — 2026-10-24

For · Google AI Studio Build project syncing to `crieck2010/FS-Exam-Prep-Mobile-App`, base commit `1c757b1` (v0.9.1, dependency diet applied)

Attachments · 1. `bank-seed-20261026.json` — the new bank file (909,289 bytes, SHA-256 `e16e1080b55514e72af520c7b8f2ab0faf2b9491fd3d7b81b8acdd3de8b14030`), generated and validated with the project's own engine (schema v1, validator-passed). 2. `2026-10-24_bank-seed-20261026-validation-note_v1.0.0.pdf` — counts, checks, caveats.

TASK: Swap the question bank for the validated 1,143-question bank (seed 20261026), and bump the version. The bank file is attached; it was produced by the project's own engine and passed the engine's schema validator. Do not edit its contents in any way.

STEP 1 — Place the bank. - Add the attached file, byte-for-byte unchanged, at: app/src/main/assets/banks/bank-seed-20261026.json - Delete the old bank: app/src/main/assets/banks/bank-seed-20261021.json - The placed file must be 909,289 bytes. If your tooling reports a different size, STOP and say so — a resized or re-serialized file is a failed swap. (After the push, Muse will verify the file's SHA-256 against e16e1080b55514e72af520c7b8f2ab0faf2b9491fd3d7b81b8acdd3de8b14030.)

STEP 2 — Point the loader at it (one line). In app/src/main/java/com/example/data/QuestionBank.kt, change ONLY the asset-path constant: "banks/bank-seed-20261021.json" -> "banks/bank-seed-20261026.json" This phase authorizes that single line in that file. Every other line of QuestionBank.kt and all other bank-loading code under data/ stays exactly as it is, and BankErrorScreen behavior is unchanged.

STEP 3 — Sweep stale references. Search the whole project for

"20261021" and for "480": - Any remaining "20261021" reference: report it; fix only if it is the bank path (Step 2 already covers the known one). - Any user-facing copy that states a question count of 480: change 480 to 1,143. (The audit found none in the UI code; report what you find either way.) Do not touch the number 480 where it means something else (e.g., a 480-second timer).

STEP 4 — Version (app/build.gradle.kts, defaultConfig): versionCode 3 -> 4 versionName "0.9.1" -> "0.9.2" Nothing else in that file (the dependency diet from the last pass stays exactly as it landed).

SCOPE FENCE: - Files that may change: the two bank asset files (add/delete), QuestionBank.kt (one line), app/build.gradle.kts (two version values), plus any file Step 3 proves carries the stale count. - No other source, theme, string, or metadata changes. No new dependencies. FsDomain.kt untouched.

REPORT BACK: 1. The placed bank file's size in bytes. 2. The QuestionBank.kt diff (must be the one constant). 3. The "20261021" and "480" search results and what you did about each hit. 4. A complete list of files changed.

After the run — the chain

1. Muse re-audits: repo file's SHA-256 must equal `e16e1080…` exactly; loader constant; version; fence.
2. PC rebuild + quick smoke (S1/S4/S10) plus one new check: start a domain quiz in **business-concepts-ethics** (the smallest domain, 107) and a mock — the mock draw of 110 must fill from the new bank without error.
3. Listing/invite copy already updated to 1,143 in the Phase 2 pack v1.0.2 / Phase 4 pack v1.0.1 — effective with this swap.
